└─\$ ssh bandit@@bandit.labs.overthewire.org -p 2220

The first thing we need to do to complete the Bandit CTF challenges is to use the SSH program to login

└─\$ ssh bandit0@bandit.labs.overthewire.org -p 2220

This command uses SSH to log in as the bandit0 user to the bandit.labs.overthewire.org server on port 2220

```
[root@localhost ~]# ssh bandit0@bandit.labs.overthewire.org -p 2220
The authenticity of host '[bandit.labs.overthewire.org]:2220 ([16.16.163.126]:22
20)' can't be established.
ECDSA key fingerprint is SHA256:IJ7FrX0mKSSHTJ63ezxjqtn0E0Hg116Aq+v5mN0+HdE.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
```

If asked if we are sure we want to continue connecting, we need to type yes, then press enter

bandit0@bandit.labs.overthewire.org's password:

Then we'll be asked to enter the user's password. Type in bandit0, then press enter. While you're typing in the password, you will not see any feedback from the terminal. This is normal

Bandit 0 – Listing Directory Contents

bandit@@bandit:~\$ ls
readme

In Linux, the ls command is used to list out the contents of a directory. When used here, we see the readme file

Bandit 0 – Reading File Contents

```
bandit0@bandit:~$ cat readme
Congratulations on your first steps into the bandit game!!
Please make sure you have read the rules at https://overthewire.org/rules/
If you are following a course, workshop, walkthrough or other educational activity,
please inform the instructor about the rules as well and encourage them to
contribute to the OverTheWire community so we can keep these games free!

The password you are looking for is: Illientry Restaurable 1515
```

The command to read a file in Linux is the cat command, and the syntax is:

cat <filename> for example cat readme

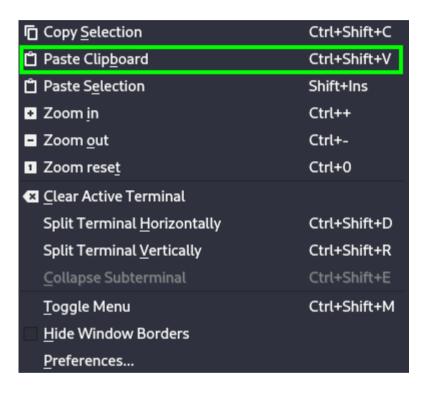

Bandit 0 – Reading File Contents

```
bandit0@bandit:~$ cat readme
Congratulations on your first steps into the bandit game!!
Please make sure you have read the rules at https://overthewire.org/rules/
If you are following a course, workshop, walkthrough or other educational activity,
please inform the instructor about the rules as well and encourage them to
contribute to the OverTheWire community so we can keep these games free!

The password you are looking for is: Illientry Restaurable 15.
```

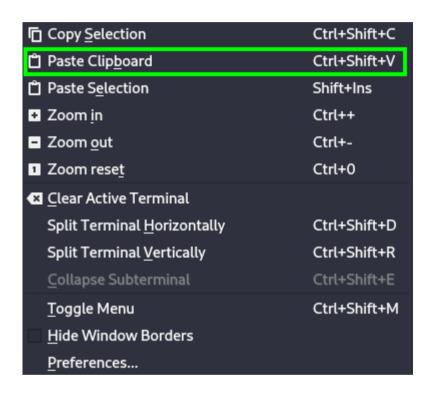

In the contents of the file, we see the password for the next level, which we will use SSH to login as the bandit1 user

Bandit 1 – Pasting in Passwords

When entering in the passwords for the Bandit CTF levels, we should paste in the password instead of keying it in

Bandit 1 – Pasting in Passwords

We can right-click then select Paste Clipboard or use the keyboard shortcut Ctrl+Shift+V

Bandit 1 – Clearing the Screen

```
bandit1@bandit:~$ ls
-
bandit1@bandit:~$ clear
```

If the screen becomes too cluttered in Linux, we can use the clear command to clear the screen and go back up to the top of the screen

```
bandit1@bandit:~$ cat -
```

This level requires us to read files with special characters, but if we try to read this file in the regular way, it doesn't work

Bandit 1 – Quitting Unresponsive Programs

```
exit
^C
bandit1@bandit:~$
```

If at any time a program becomes unresponsive in Linux, we can use the Ctrl+C keyboard shortcut to terminate the program

- 1) Filenames should not include spaces. We can use underscores if we want to use spaces, e.g., my_file
- 2) Filenames should not start with numbers, because certain numbers are treated as special characters in Linux
- 3) Filenames should never start with special characters

```
bandit1@bandit:~$ cat ./-
```

We can read files with special characters by referencing the exact directory where the file is. In Linux, the current directory is referenced with . /

```
bandit1@bandit:~$ cat ./-
```

So to reference a file named – in the current directory, it would be . / -

```
bandit2@bandit:~$ cat spaces in this filename
cat: spaces: No such file or directory
cat: in: No such file or directory
cat: this: No such file or directory
cat: filename: No such file or directory
```

In this level, we need to read a file with spaces in its name. If we try to read this file normally, we won't be able to, since the Linux interprets the spaces as the end of one file name and the beginning of another

```
bandit2@bandit:~$ cat spaces in this filename
cat: spaces: No such file or directory
cat: in: No such file or directory
cat: this: No such file or directory
cat: filename: No such file or directory
```

And this is why its not recommended to put spaces in filenames. However, there's a couple of methods we could use to reference filenames with spaces in them

bandit2@bandit:~\$ cat "spaces in this filename"

The first method is to wrap the name of the file in quotes, either single quotes or double quotes. This ensures that Linux will interpret everything in the quotes as a single object

bandit2@bandit:~\$ cat spaces\ in\ this\ filename

The second method to insert a backslash character before every space in the filename, which lets Linux know that the space is not the start of a new filename, but part of the current filename

Bandit 3 – Changing Directories

```
bandit3@bandit:~$ ls
inhere
bandit3@bandit:~$ cd inhere
```

In Linux, we can move into a directory by using the cd command. The syntax is cd <directory_name>, for example, cd inhere

Bandit 3 – Checking the Current Directory

```
bandit3@bandit:~/inhere$ pwd
/home/bandit3/inhere
```

If we want to check our current directory, we can use the pwd (present working directory) command. In Linux, all directories are start with a /, for example, the /home/bandit3/inhere directory

Bandit 3 – Hidden Files

```
bandit3@bandit:~/inhere$ ls -la
total 12
drwxr-xr-x 2 root root 4096 Sep 19 2024 .
drwxr-xr-x 3 root root 4096 Sep 19 2024 .
-rw-r—— 1 bandit4 bandit3 33 Sep 19 2024 ... Hiding-From-You
```

In Linux, any file or directory that start with a . is a hidden file, which means that it won't appear when using the ls command in the regular way.

Bandit 3 – Hidden Files

```
bandit3@bandit:~/inhere$ ls -la
total 12
drwxr-xr-x 2 root root 4096 Sep 19 2024 .
drwxr-xr-x 3 root root 4096 Sep 19 2024 .
-rw-r—— 1 bandit4 bandit3 33 Sep 19 2024 ... Hiding-From-You
```

The current directory in Linux is denoted as . and because its name starts with a dot, it is hidden by default. The same goes for the directory above the current one, which is . .

Bandit 3 – Hidden Files

```
bandit3@bandit:~/inhere$ ls -la
total 12
drwxr-xr-x 2 root root 4096 Sep 19 2024 .
drwxr-xr-x 3 root root 4096 Sep 19 2024 .
-rw-r—— 1 bandit4 bandit3 33 Sep 19 2024 ... Hiding-From-You
```

To see hidden files with the ls command, we have to use the command with an argument -a, which alters the output of the command by including hidden files in the output

Bandit 4 – Text versus Data Content

```
bandit4@bandit:~/inhere$ cat ./-file00

*p**&*y*,*(jo*.at*:uf*^***@bandit4@bandit:~/inhere$
```

Computer files typically contain one of two types of content, human-readable text, or machine-readable data

Bandit 4 – Text versus Data Content

```
bandit4@bandit:~/inhere$ cat ./-file00

*p**&*y*,*(jo*.at*:uf*^***@bandit4@bandit:~/inhere$
```

Files with data content are meant to be processed by computer software, and will not be readable if read by using the cat command

Bandit 4 – Text versus Data Content

```
bandit4@bandit:~/inhere$ ls -l
total 40
-rw-r----- 1 bandit5 bandit4 33 Sep 19 2024 -file00
-rw-r- 1 bandit5 bandit4 33 Sep 19
                                     2024 -file01
-rw-r- 1 bandit5 bandit4 33 Sep 19
                                     2024 -file02
-rw-r- 1 bandit5 bandit4 33 Sep 19
                                     2024 -file03
-rw-r- 1 bandit5 bandit4 33 Sep 19
                                     2024 -file04
-rw-r- 1 bandit5 bandit4 33 Sep 19
                                     2024 -file05
-rw-r- 1 bandit5 bandit4 33 Sep 19
                                     2024 -file06
-rw-r- 1 bandit5 bandit4 33 Sep 19
                                     2024 -file07
-rw-r- 1 bandit5 bandit4 33 Sep 19
                                     2024 -file08
-rw-r- 1 bandit5 bandit4 33 Sep 19
                                     2024 -file09
```

In this level, we're meant to find out which file contains text contents, not binary. It would be tedious to look through the files one by one, but there's a way to scan all of the files at once

Bandit 4 – File Command

```
bandit4@bandit:~/inhere$ file ./-file00
./-file00: data
```

The file command in Linux is used to return the type of contents in a file

Bandit 4 – The * Wildcard Character

```
bandit4@bandit:~/inhere$ file ./*
./-file00: data
./-file01: data
./-file02: data
./-file03: data
./-file04: data
./-file05: data
./-file06: data
./-file07: ASCII text
./-file08: data
./-file09: data
```

The * special character in Linux is used as a shorthand for "all files", and we can run a command like the one above to combine the file command with the * wildcard character to run the command on all the files in the directory

The Find command is used to search for files on the system. It can used with many different arguments and flags to refine its search parameters.

The Find command allows a search of files and / or directories in the file system, and matches files in the output according to the criteria provided by the command arguments.

The argument -type searches by file or directories and the argument -size searches for files of a particular size.

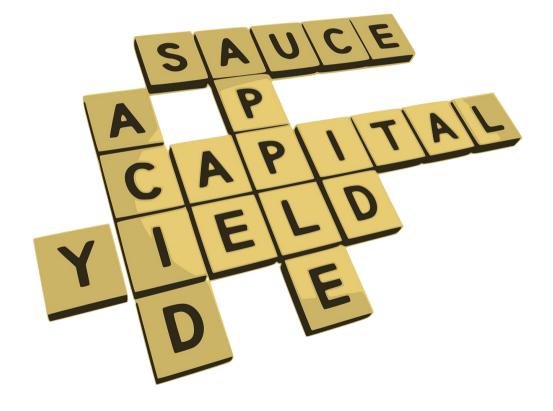

```
find -type f./example.txt
```

- 1 The command itself
- 2 The location to be searched
- 3 The size of data to be returned
- 4 The executable status

- 1 The command itself
- 2 The location to be searched
- 3 The type of data to be returned, file / directory
- 4 The file / directory user ownership
- 5 The file / directory group ownership
- 6 The file / directory size
- 7 Omit error messages from output

Bandit 7 - Grep Command

The Grep command searches within the contents of files for specified strings. It is very commonly used to pick out specific words or phrases.

Bandit 7 - Grep Command

- 1 The command itself
- 2 The pattern to search for in the file / directory
- 3 The file to be searched

Bandit 8 - Sort Command

The Sort command takes all of the lines contained within a given file and returns them in alphabetical / numerical order.

Bandit 8 - Sort Command

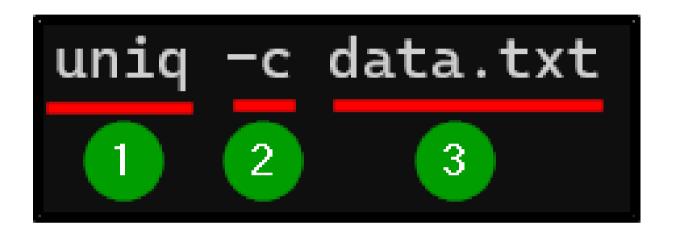

- 1 The command itself
- 2 The input to be sorted

Bandit 8 - Uniq Command

The Uniq command takes all of the lines in a file and removes any lines with identical contents to the one above it. This command is very useful for removing consecutive blank lines in a given file

Bandit 8 - Uniq Command

- 1 The command itself
- 2 The count flag
- 3 The file to be processed

Bandit 8 - Command Piping

```
sort data.txt | uniq -c
```

In Linux, command piping is the process of passing the output of one command into the input of a second command.

Bandit 8 - Command Piping

```
sort data.txt | uniq -c
```

This is a very useful feature, because it allows commands to be chained together to achieve a lot of flexible output.

Bandit 8 - Command Piping

- 1 The first command
- 2 The first command's input
- 3 The pipe
- 4 The second command
- 5 The second command's switch

Bandit 9 - Binary Data and Text Strings

The contents of most computer files can be roughly divided into two types:

Binary Data – Which is intended to be read by software

Text Strings – Which is intended to be read by humans

Bandit 9 - Binary Data and Text Strings

```
C:\Users\User>type c:\windows\system32\cmd.exe

MZÉ♥♦ ¬@°▼|| =!¬@L=!This program cannot be run in DOS mode.
$φ÷Qürù?πrù?πrù?πr∩> \( \frac{1}{2} \times \) \( \frac{1}{2} \)
```

Files containing binary data will output gibberish when read from the CLI console.

Bandit 9 - Strings Command

The Strings command is used to return human-readable text from files. It is often used to find text inside of files that also contain both text and binary data.

Bandit 9 - Strings Command

- 1 The command itself
- 2 The file to extract strings from

The Base64 command encodes / decodes data according to the Base64 system. It is often used to convert data for transmission across computer networks.

0 A	16 Q	32 g	48 w
1 B	17 R	33 h	49 x
2 C	18 S	34 I	50 y
3 D	19 T	35 j	51 z
4 E	20 U	36 k	52 0
5 F	21 V	37 1	53 1
6 G	22 W	38 m	54 2
7 H	23 X	39 n	55 3
8 I	24 Y	40 o	56 4
9 J	25 Z	41 p	57 5
10 K	26 a	42 q	58 6
11 L	27 b	43 r	59 7
12 M	28 c	44 s	60 8
13 N	29 d	45 t	61 9
14 O	30 e	46 u	62 +
15 P	31 f	47 v	63 /

The characters used in Base 64 encoding are shown here. Note that all Base 64 encoded strings must consist of a number of characters that is divisible by 4.

0 A	16 Q	32 g	48 w
1 B	17 R	33 h	49 x
2 C	18 S	34 I	50 y
3 D	19 T	35 j	51 z
4 E	20 U	36 k	52 0
5 F	21 V	37 1	53 1
6 G	22 W	38 m	54 2
7 H	23 X	39 n	55 3
8 I	24 Y	40 o	56 4
9 J	25 Z	41 p	57 5
10 K	26 a	42 q	58 6
11 L	27 b	43 r	59 7
12 M	28 c	44 s	60 8
13 N	29 d	45 t	61 9
14 O	30 e	46 u	62 +
15 P	31 f	47 v	63 /

secho -n password | base64 cGFzc3dvcmQ=

In cases where an encoded string is not divisible by 4, the encoding process will "pad out" the string with equal symbols until the string is divisible by 4.

- 1 The command itself
- 2 The decode switch
- 3 The file to be operated upon

Bandit 11 – ROT13 Cipher

```
bandit11@bandit:~$ cat data.txt
Gur cnffjbeq vf 7k16JArUVv5LxVuJfsSVdbbtaHGlw9D4
```

The data.txt file contents are an encrypted message. The encryption method is called ROT13

Bandit 11- ROT13 Cipher

The ROT13 cipher is a simple substitution cipher where the encryption method is shift each plaintext letter 13 positions in the alphabet to form the ciphertext

Bandit 11- ROT13 Cipher

hackerfrogs

unpxresebtf

So if we use this cipher to encrypt the plaintext hackerfrogs, the resulting ciphertext would be unpxresebtf

Bandit 11- ROT13 Cipher

hackerfrogs

unpxresebtf

To decrypt the ciphertext we would do the same operation, shifting each ciphertext letter by 13 places in the alphabet

Bandit 11 - Tr Command

bandit11@bandit:~\$ cat data.txt | tr 'A-Za-z' 'N-ZA-Mn-za-m'
The password is

The Linux Tr command can be used to transform specified characters to other specified characters, and it can be used to simulate ROT13 decryption

Bandit 12 – XXD Command

xxd -r data.txt > data

In Linux, the XXD program is used to both create hex dump files as well as convert those hex dump files back into their original formats

Bandit 12 – Compressed Files

```
bandit12@bandit:/tmp/...bandit12theshyhat$ file data
data: gzip compressed data, was "data2.bin", last modi
2024, max compression, from Unix, original size modulo
```

In computing, compression is often used to reduce the size of files, either to reduce the amount of storage space for those files or to transmit them across networks

Bandit 12 – Compressed Files

```
bandit12@bandit:/tmp/...bandit12theshyhat$ gunzip data
gzip: data: unknown suffix -- ignored
```

Depending on the method of compression, different programs need to be used to decompress the files and get access to the original contents

Bandit 12 – Compressed Files

```
bandit12@bandit:/tmp/...bandit12theshyhat$ gunzip data
gzip: data: unknown suffix -- ignored
```

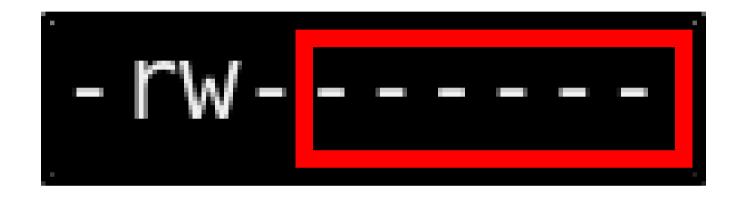

In addition, many programs will not decompress a file unless it has a specific file extension

Bandit 13 – SSH Private Keys

bandit13@bandit:~\$ file sshkey.private
sshkey.private: PEM RSA private key

SSH private keys are an alternative method of login via the SSH program

Bandit 13 – SSH Private Keys

In order to use an SSH private key, it must have the correct file permissions: specifically, the file must not have global or group permissions of any kind
